# INTERNATIONAL A-LEVEL FURTHER MATHEMATICS

(9665/FM04) Unit FS2 Statistics

### Time allowed: 1 hour 30 minutes

#### Materials

- For this paper you must have the Oxford International AQA Booklet of Formulae and Statistical Tables (enclosed).
- You may use a graphic calculator.

#### Instructions

- Use black ink or black ball-point pen. Pencil should only be used for drawing.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.

#### Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 80.

#### Advice

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.
- Show all necessary working; otherwise marks may be lost.

**1** The diameters of the metal discs produced by a machine have a normal distribution with standard deviation 1 millimetre.

The machine breaks down. After it is repaired, a random sample of 101 metal discs produced by the machine is taken.

The sample standard deviation is found to be 1.2 millimetres.

The owner of the machine is concerned that the population standard deviation may have increased.

Investigate whether the population standard deviation has increased, using the 1% level of significance.

At a particular company, a random sample of the employees was selected.

Each employee was asked whether they were 'satisfied' or 'not satisfied' working for the company.

The results are shown in the following table.

3

|        | Satisfied | Not satisfied | Total |
|--------|-----------|---------------|-------|
| Male   | 21        | 19            | 40    |
| Female | 27        | 13            | 40    |
| Total  | 48        | 32            | 80    |

Test if there is an association between gender and survey response, using the 10% level of significance.

#### 5 Huang is investigating the weekly household income in a country.

In this country, the weekly household income has a normal distribution.

Huang takes a random sample of 5 households.

Their weekly household income, in dollars, was recorded in a particular week in 2008 and then recorded again in 2018 in the corresponding week.

The results are shown in the following table.

| Household | 2008 (\$) | 2018 (\$) |
|-----------|-----------|-----------|
| А         | 600       | 610       |
| В         | 597       | 600       |
| С         | 602       | 602       |
| D         | 605       | 603       |
| E         | 598       | 598       |

Huang claims that the mean weekly household income in 2018 has not changed compared with the mean weekly household income in 2008

Test Huang's claim, using the 10% level of significance.

## Justine is investigating the heights of women who play basketball.

She takes a random sample of 400 women who play basketball and measures their heights,  $X\,{\rm centimetres}.$ 

She also takes a random sample of 300 women who do not play basketball and measures their heights, *Y* centimetres.

Her results are summarised as

6

 $\sum x = 65760$  and  $\sum x^2 = 10814020$  $\sum y = 49197$  and  $\sum y^2 = 8070022$ 

The heights of women who play basketball and the heights of women who do not play basketball are independent.

Justine claims that the mean height of women who play basketball is greater than the mean height of women who do not play basketball.

Test Justine's claim, using the 5% level of significance.

[12 marks]
